

IMPERILED OR SIGNIFICANT SPECIES OR COMMUNITIES by WORLDWIDE STATUS

Occurrences by Worldwide Rank

- critically imperiled (5 or fewer occurrences)
- imperiled globally (6-20 occurrences)
- "very rare" or restricted range (21-100 occurrences)
- apparently globally secure
- demonstrably globally secure
- global rank uncertain
- unknown

The data shown on this map are part of the Natural Heritage Inventory (NHI). Each "element" of the NHI consists of one rare or naturally significant species or community. An "occurrence" of an element is a locational record representing a single, extant habitat, which sustains or otherwise contributes to the survival of a population or self-sustaining example of a particular element. An element rank is based on the number of occurrences of that element worldwide. A statewide ranking system also exists.

The NHI is NOT a comprehensive survey. Negative data are not tracked. Therefore ABSENCE OF AN OCCURRENCE AT A POINT IS NOT EVIDENCE THAT THAT ELEMENT DOES NOT OCCUR AT THAT LOCATION.
